

## Maintenance Program Calculator

Calculating for the maintenance program is simple. Take the number of gallons necessary for the initial program from line (4) \_\_\_\_\_ and multiply it times 0.25: \_\_\_\_\_

For the maintenance program, it takes less of the mixture per application, only 8 oz. or one half of the amount required for initial treatment. So that makes the amount of necessary concentrate only one half of that needed for the initial treatment. And, you are treating only once a day, in the evening after you have completed all closing duties. Therefore you are able to cut the number in half again.

It a nut shell, you can treat all of the areas of your restaurant during the maintenance program for a full month on the same amount of That Orange Stuff that you used for one week during the initial elimination phase. I think we can all agree that it is a fraction of the cost of lost food, wine, liquor, and customers that comes with a fruit fly infestation.
